

Créer sa CA et signer ses certificats

Création de la CA

Pour cela, on va se rendre dans un dossier isolé :

```
# mkdir /root/ca && cd /root/ca
```

puis on va créer l'organisation de dossier suivante:

```
# mkdir certs crl newcerts private csr
```

```
# chmod 700 private
```

Et on créer les fichiers de contrôle :

```
# touch index.txt
```

```
# echo 1000 > serial
```

puis on créer le fichier :

[openssf.cnf](#)

```
[ ca ]
# `man ca`
default_ca = CA_default

[ CA_default ]
# Directory and file locations.
dir                = .
certs              = $dir/certs
crl_dir            = $dir/crl
new_certs_dir     = $dir/newcerts
database          = $dir/index.txt
serial            = $dir/serial
RANDFILE          = $dir/private/.rand

# The root key and root certificate.
private_key       = $dir/private/ca.key
certificate       = $dir/certs/ca.pem

# For certificate revocation lists.
crlnumber        = $dir/crlnumber
crl              = $dir/crl/ca.crl
crl_extensions   = crl_ext
default_crl_days = 30
```

```
# SHA-1 is deprecated, so use SHA-2 instead.
default_md          = sha256

name_opt           = ca_default
cert_opt           = ca_default
default_days       = 375
preserve           = no
policy             = policy_loose

[ req ]
# Options for the `req` tool (`man req`).
default_bits       = 4096
distinguished_name = req_distinguished_name
string_mask        = utf8only

# SHA-1 is deprecated, so use SHA-2 instead.
default_md          = sha256

# Extension to add when the -x509 option is used.
x509_extensions    = v3_ca

[ req_distinguished_name ]
countryName          = Country Name (2 letter code)
stateOrProvinceName = State or Province Name
localityName         = Locality Name
O.organizationName   = Organization Name
organizationalUnitName = Organizational Unit Name
commonName           = Common Name
emailAddress         = Email Address

countryName_default      = FR
stateOrProvinceName_default =
localityName_default     =
O.organizationName_default = VirtIT
#organizationalUnitName_default =
emailAddress_default     =

[ v3_ca ]
# Extensions for a typical CA (`man x509v3_config`).
subjectKeyIdentifier = hash
authorityKeyIdentifier = keyid:always,issuer
basicConstraints = critical, CA:true
keyUsage = critical, digitalSignature, cRLSign, keyCertSign

[ policy_loose ]
# Allow the intermediate CA to sign a more diverse range of
certificates.
# See the POLICY FORMAT section of the `ca` man page.
countryName          = optional
```

```
stateOrProvinceName      = optional
localityName             = optional
organizationName         = optional
organizationalUnitName   = optional
commonName               = supplied
emailAddress              = optional

[ server_cert ]
# Extensions for server certificates (`man x509v3_config`).
basicConstraints = CA:FALSE
nsCertType = server
nsComment = "OpenSSL Generated Server Certificate"
subjectKeyIdentifier = hash
authorityKeyIdentifier = keyid,issuer:always
keyUsage = critical, digitalSignature, keyEncipherment
extendedKeyUsage = serverAuth

[ usr_cert ]
# Extensions for client certificates (`man x509v3_config`).
basicConstraints = CA:FALSE
nsCertType = client, email
nsComment = "OpenSSL Generated Client Certificate"
subjectKeyIdentifier = hash
authorityKeyIdentifier = keyid,issuer
keyUsage = critical, nonRepudiation, digitalSignature, keyEncipherment
extendedKeyUsage = clientAuth, emailProtection
```

On génère ensuite la clé privé du CA root :

```
# openssl genrsa -out private/ca.key 4096
```

et puis le certificat :

```
# openssl req -config openssl.cnf \
  -key private/ca.key \
  -new -x509 -days 7300 -extensions v3_ca \
  -out certs/ca.pem
```

Création d'un certificat

Il faut d'abord créer la clé privée du certificat :

```
# openssl genrsa -out private/server.key 4096
```

puis le CSR :

```
# openssl req -config openssl.cnf -key private/server.key -new -out
```

```
csr/server.csr
```

Et puis on le signe :

```
# openssl ca -config openssl.cnf -extensions server_cert -days 375 -notext -  
in csr/server.csr -out certs/server.pem
```
